

Deer Ticks- Introduction

▪ *Ixodes scapularis*, or “deer tick”, is a vector for the pathogen, *Borrelia burgdorferi*, which is responsible for Lyme disease in humans (Guerra et al., 2002). This makes deer ticks and their lifecycle an important area of study.

▪ There are three stages of a deer tick’s lifecycle. During stage one, the tick is a larva. During stage two, the tick is a nymph. Stage three is when the tick is an adult. Each stage of a deer tick’s lifecycle starts once they molt after a blood meal (Deer Tick Ecology, 2010).

▪ A tick cannot transmit Lyme disease upon being hatching from the egg. The tick must first feed on a host that is already infected with the pathogen before it can transmit it to a host (Deer Tick Ecology, 2010).

▪ Understanding the lifecycle of a tick and how it can transmit Lyme disease is crucial when it comes to prevention of this disease. This project aims to illustrate the lifecycle using a computer program called STELLA.

Life Cycle Parameters			
Status of Tick	Stock/Flow	Transient Time (Days)	Initial Value Individuals (Input)
Egg	Stock	500	100
Hatch	Flow	500	NA
Larvae	Stock	60	10
Eat 1	Flow	60	NA
Blood Meal 1	Stock	3	0
Molt 1	Flow	3	NA
Nymph	Stock	60	10
Eat 2	Flow	60	NA
Blood Meal 2	Stock	3	0
Molt 2	Flow	3	NA
Adult	Stock	60	10 *
Eat 3	Flow	60	NA
Blood Meal 3	Stock	3	0
Develop Eggs	Flow	3	NA
Egg Laying Females	Stock	3	0
Egg Laying	Flow	3	NA

Figure 1: Life Cycle parameters used in the STELLA model. * The initial value of adult ticks is fifty percent male and fifty percent female.

Deer Ticks: A Model of Their Lifecycle Using STELLA

By Austin Sawyer, Adviser: Michael Palace

Environmental Science Major, Earth System Research Center
University of New Hampshire, Durham New Hampshire

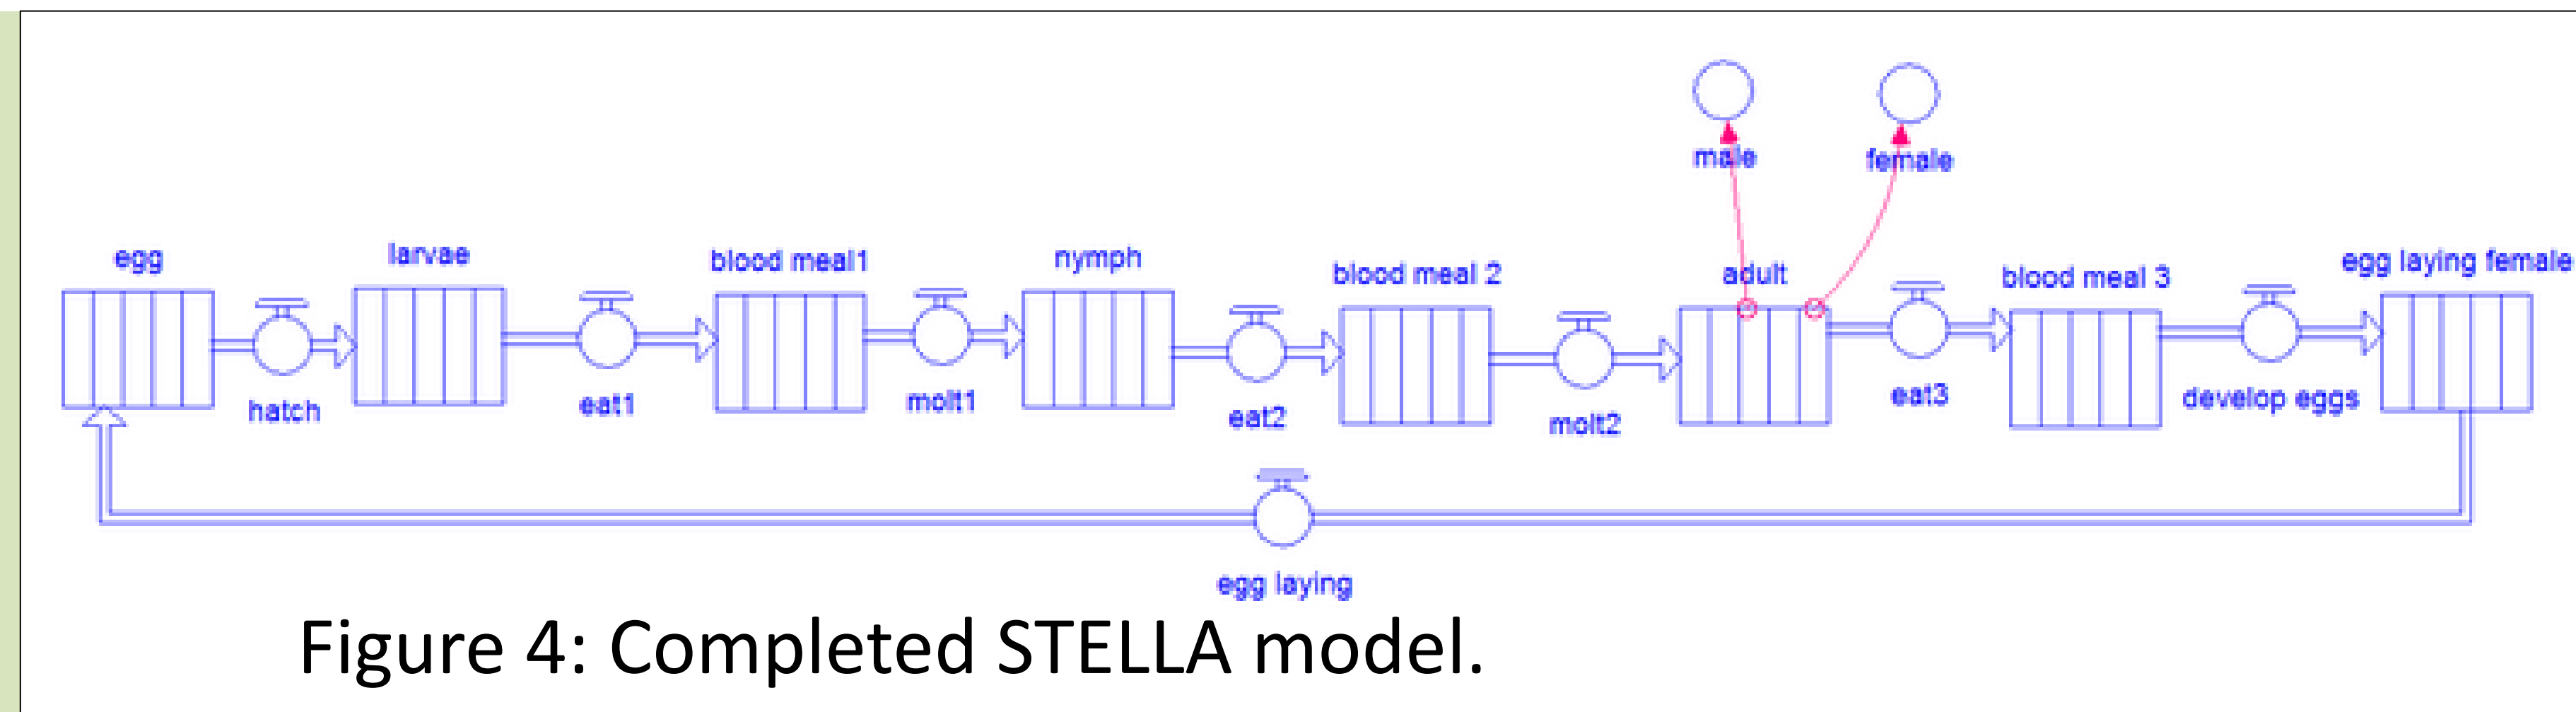

Figure 4: Completed STELLA model.

Methods

▪ Reviewed literature for information and parameters that could be used in the Stella model.

▪ Referenced literature for potential modeling efforts on tick life cycle

▪ Using STELLA, a model was created to illustrate the two-year life cycle of a deer tick. Data was used from literature to best represent the reality of the cycle.

▪ Conveyors were used to represent each stage in the life cycle.

▪ Parametrized model using values found in the literature

▪ Ran model and examined the output by comparing with previous modeling efforts

▪ Suggested improvements and future areas of data needs.

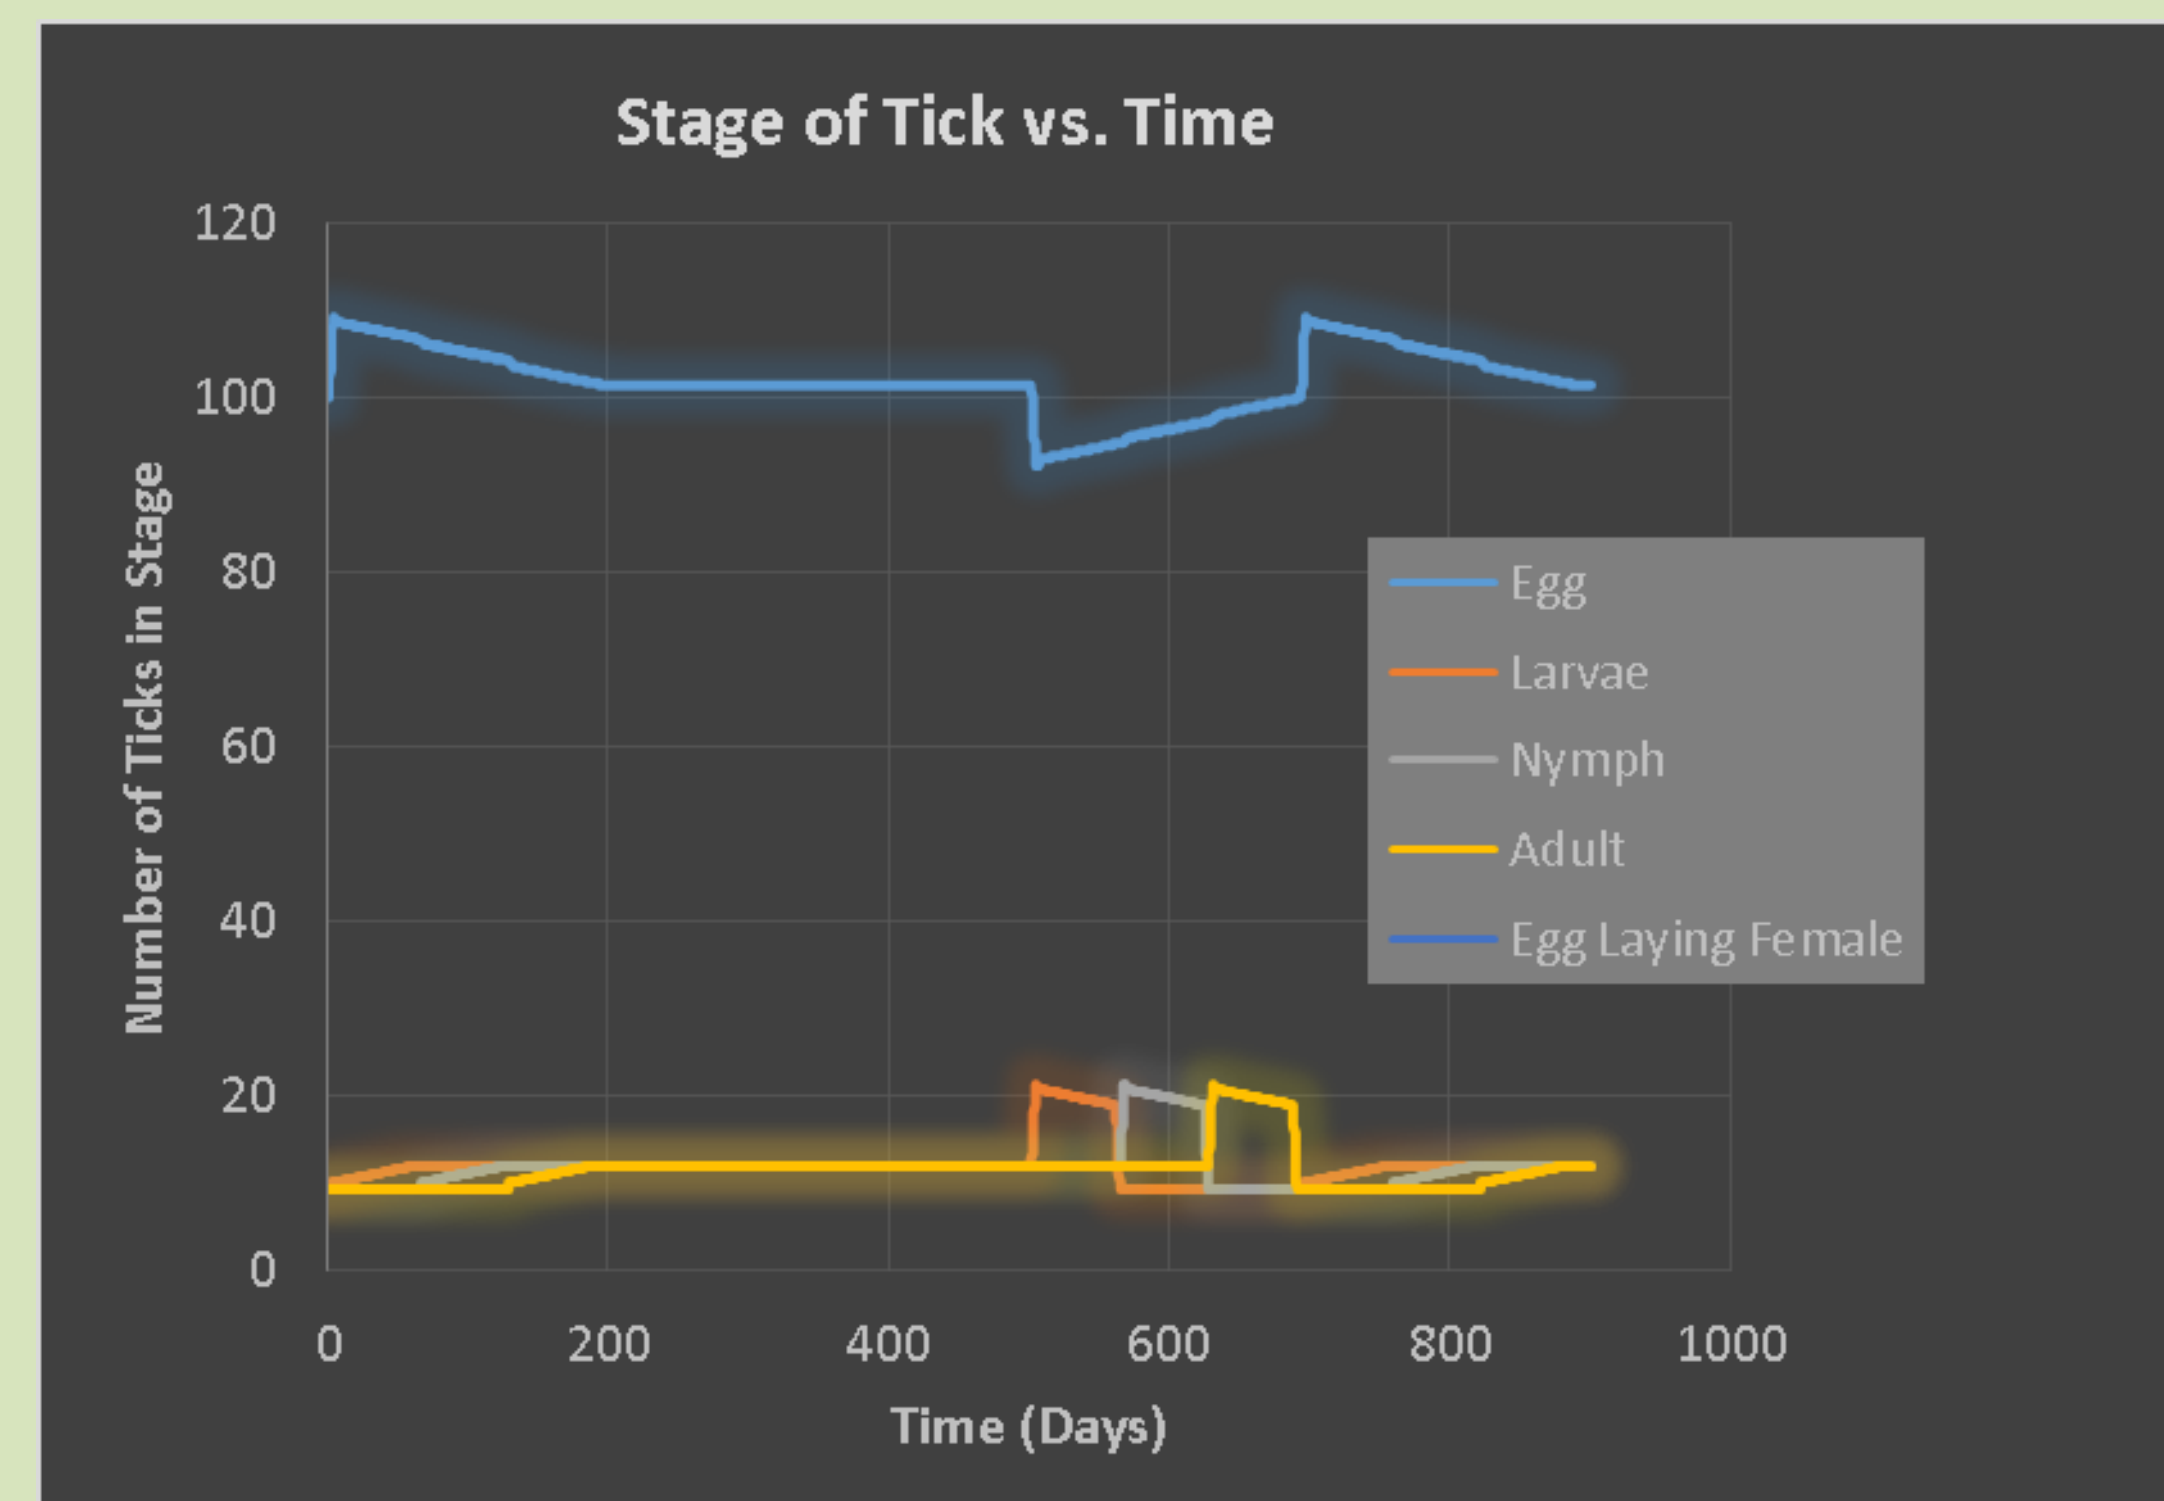

Figure 3: A graph of a deer tick’s lifecycle using values from the STELLA model.

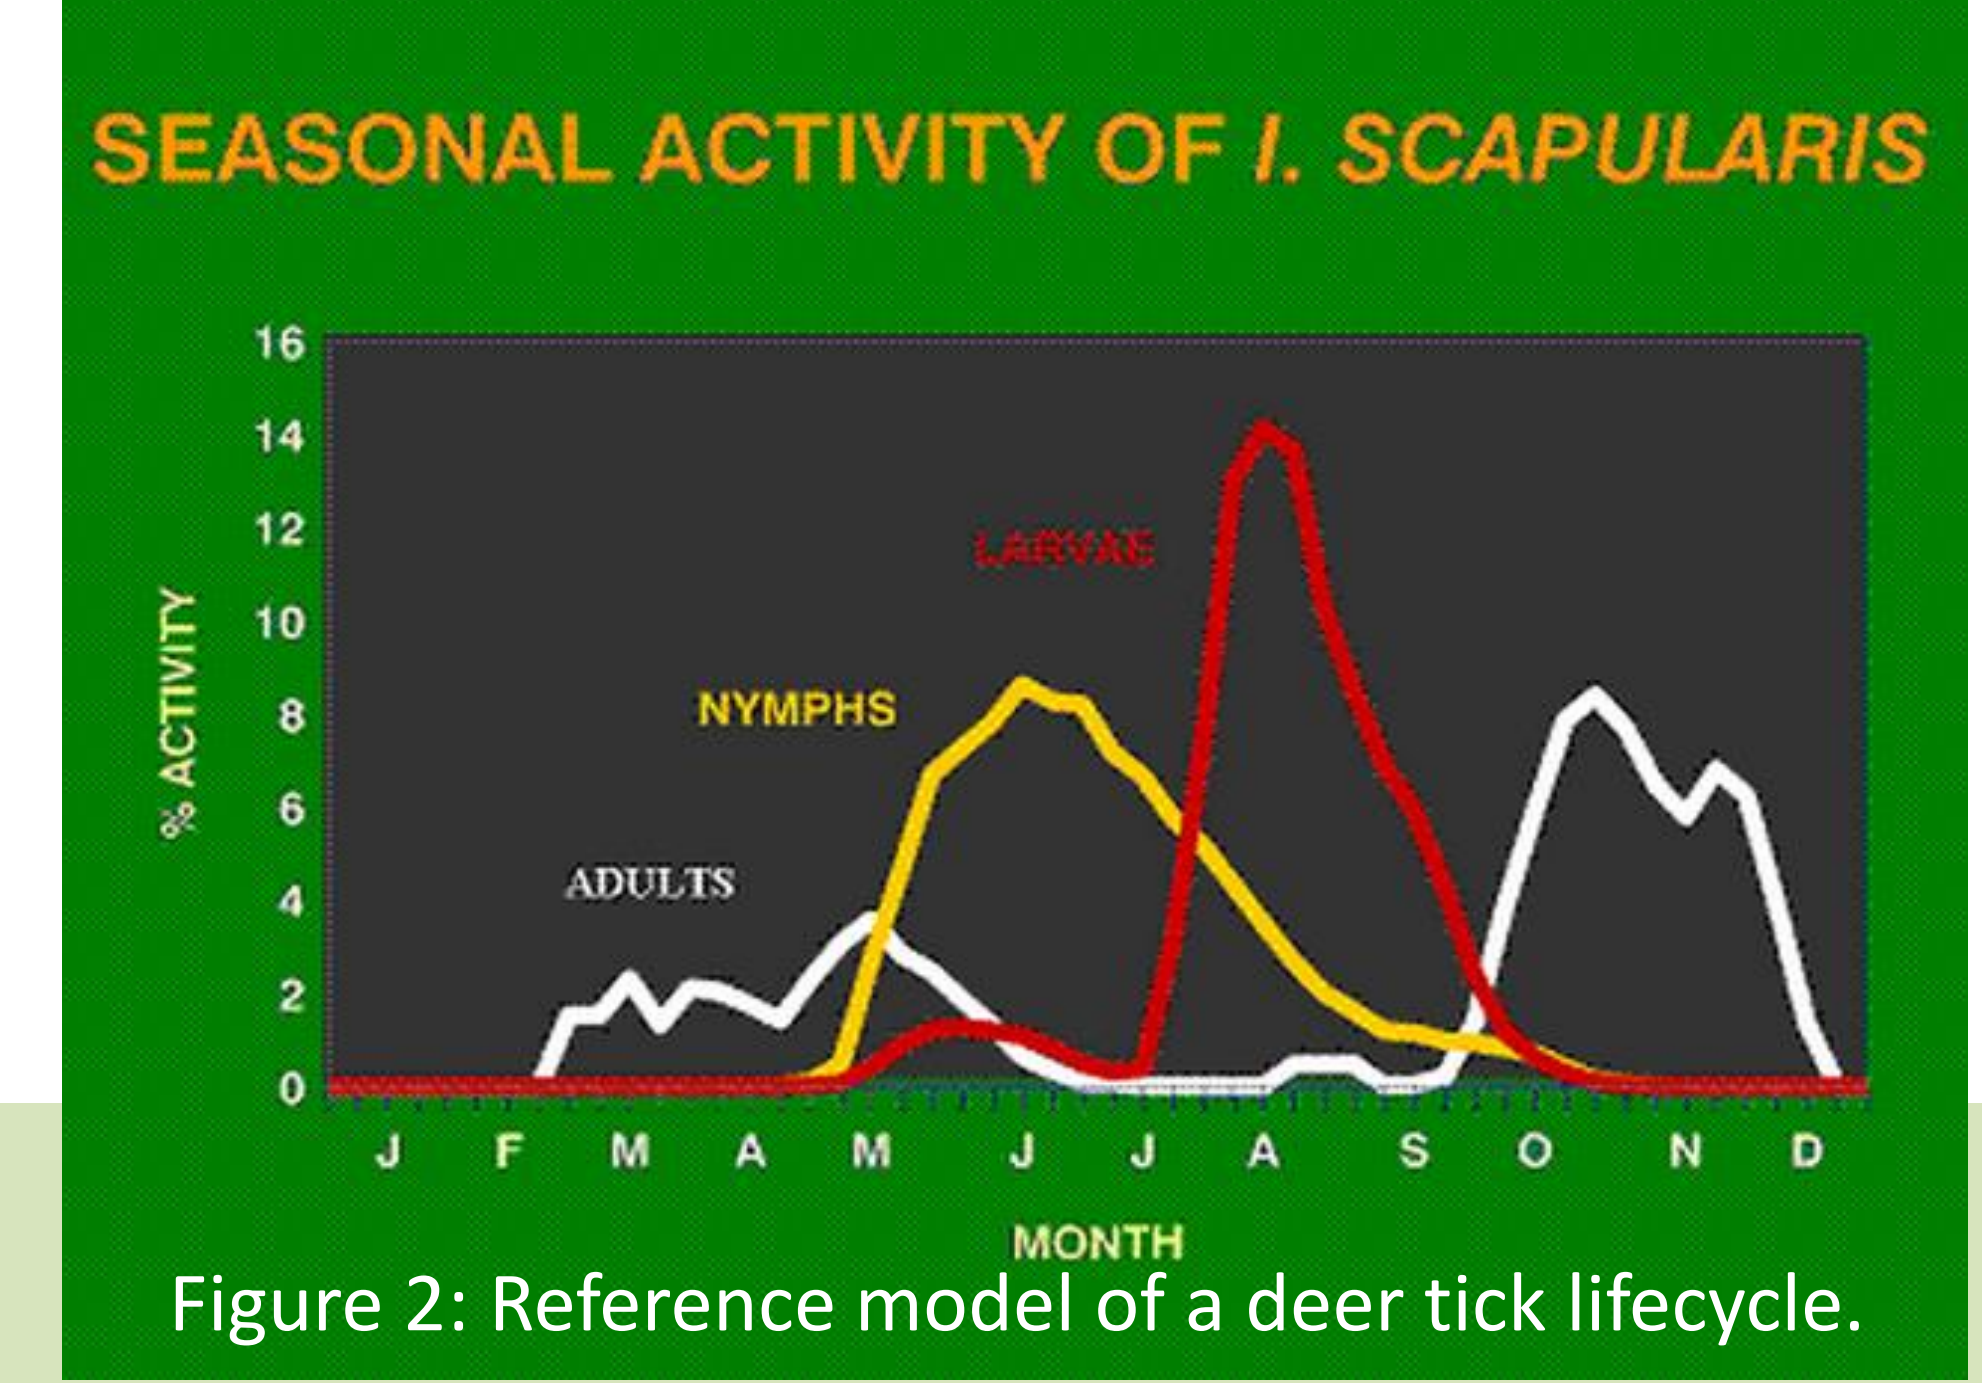

Figure 2: Reference model of a deer tick lifecycle.

Conclusion

▪ The finalized model was similar to the reference model, but is lacking detail (i.e., accurate parameters).

▪ More data needs to be found in order to make the data more accurate.

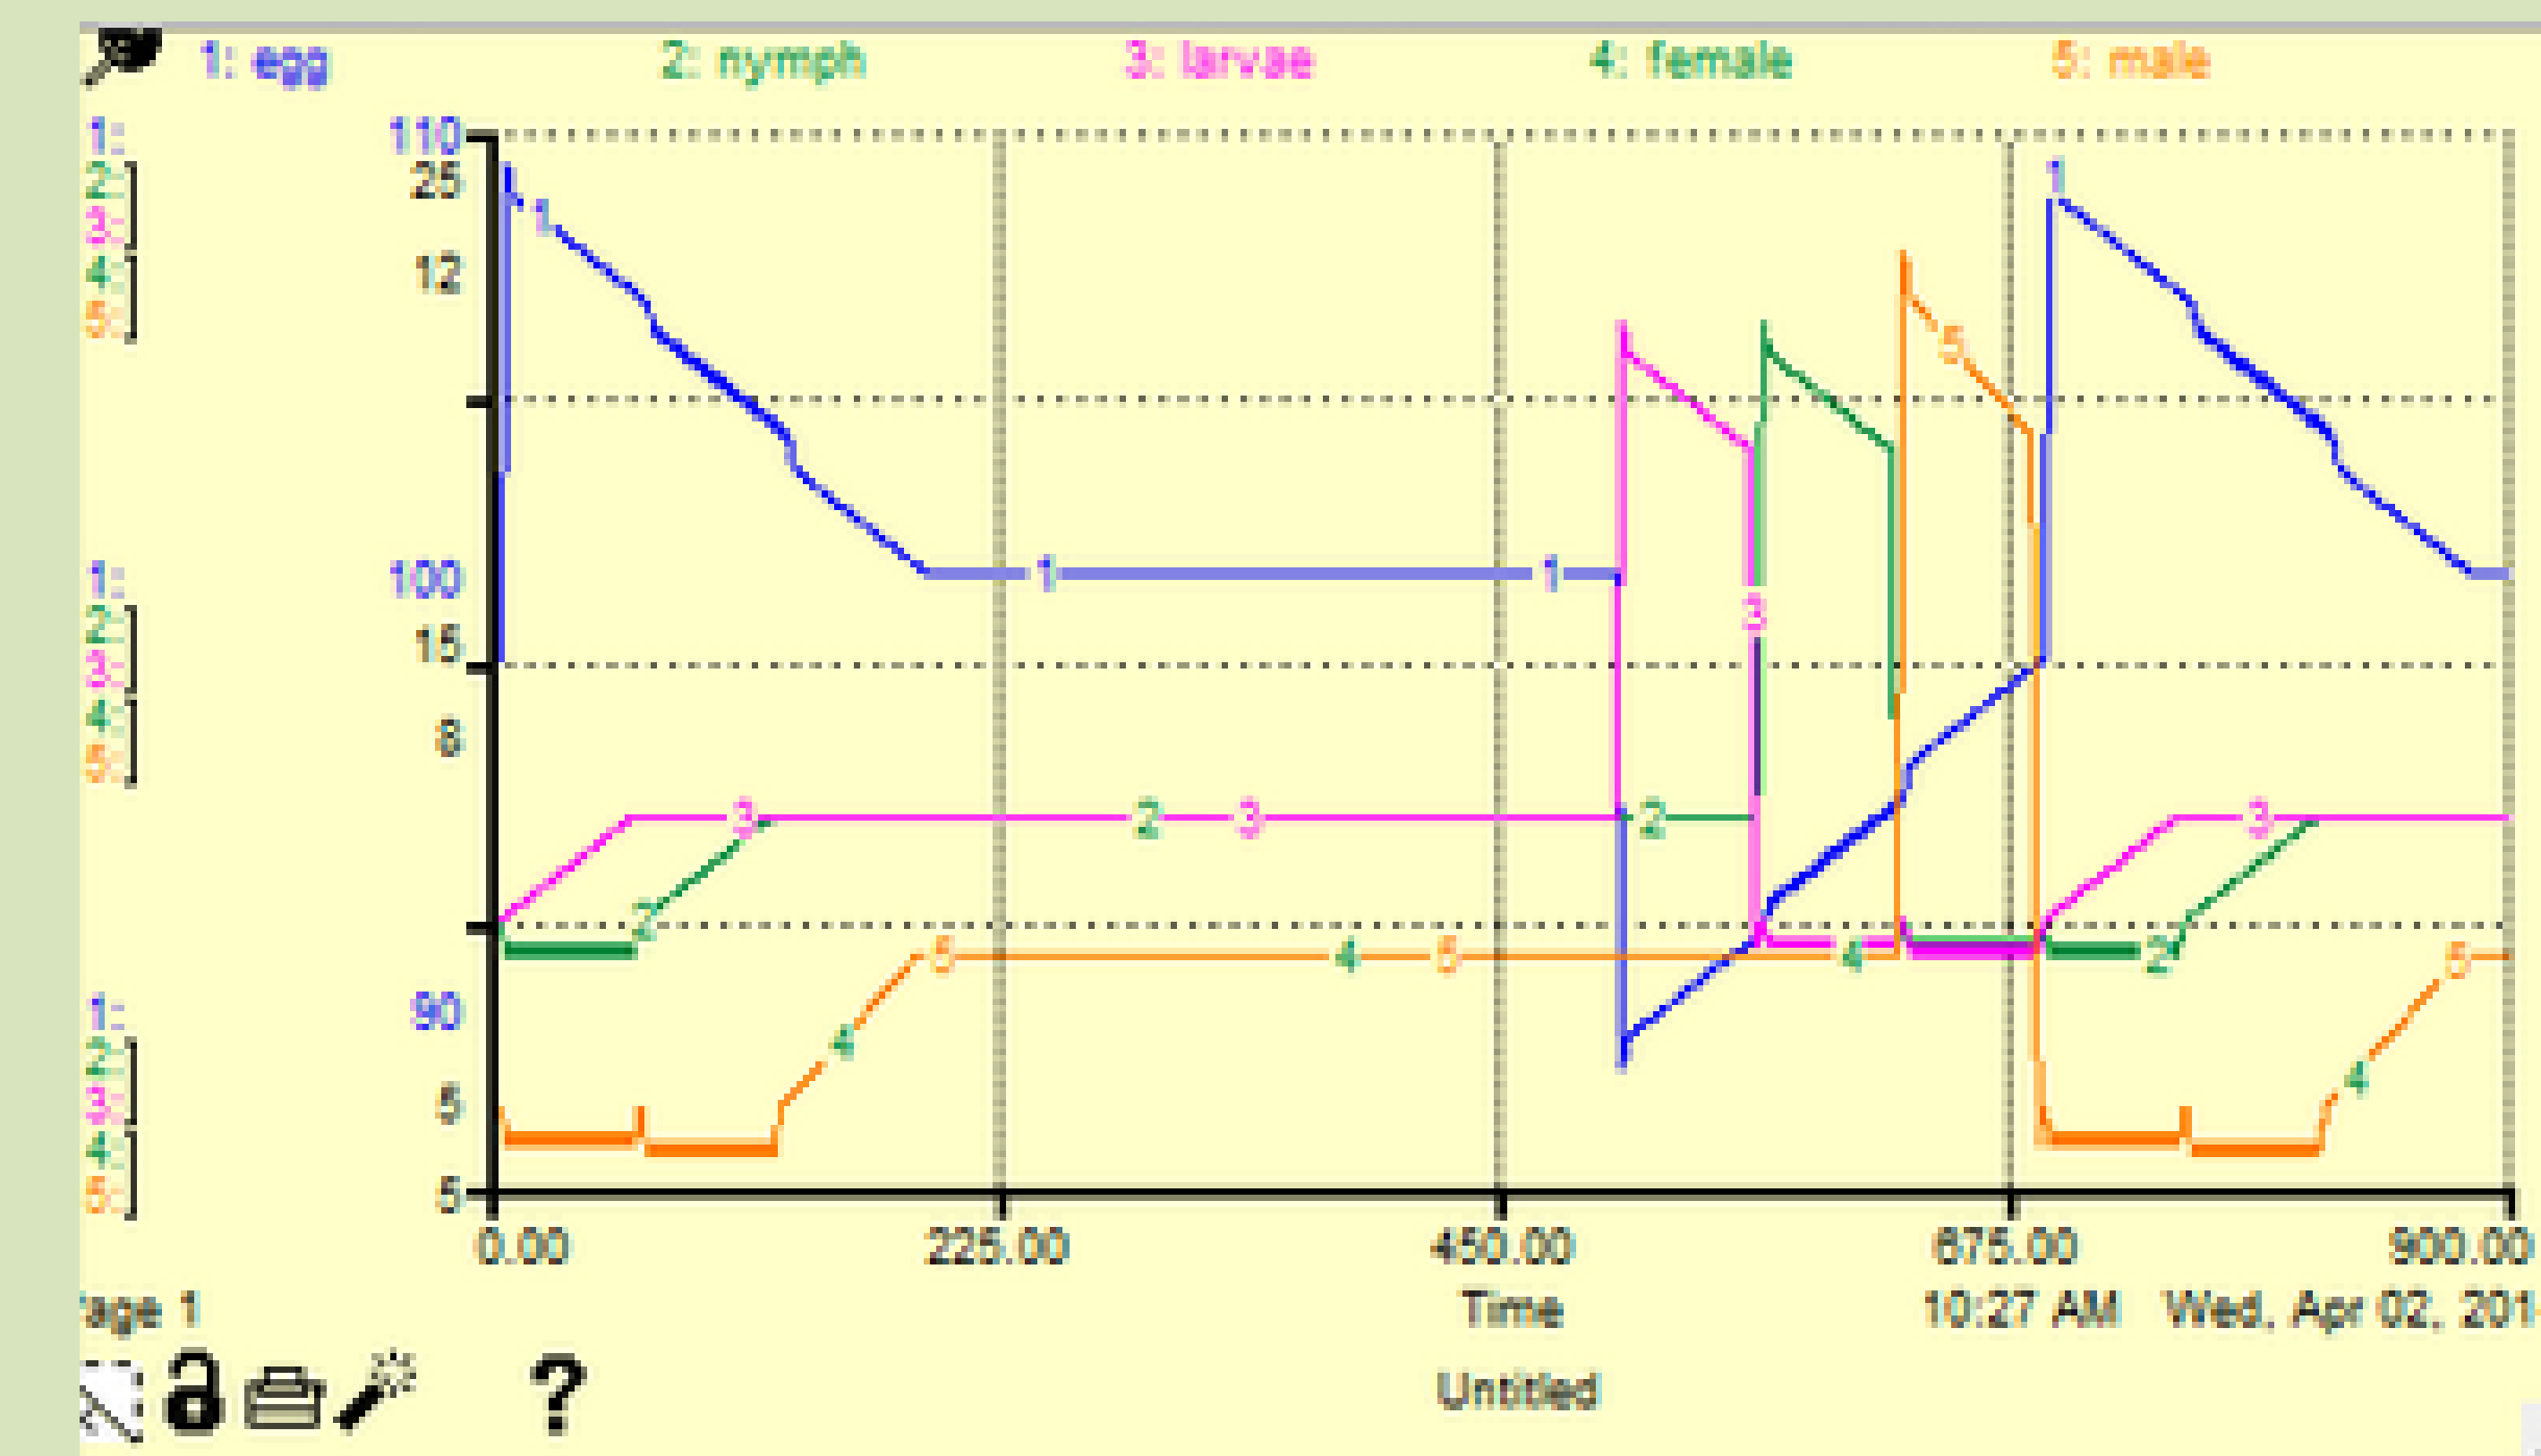

Figure 5: STELLA graph of tick life cycle.
